Firewall policy review

External-FW · 09 Oct 2026, 02:00 UTC

99/100	16	not conformant	4
OPTIMIZER SCORE	RULES ANALYSED	COMPLIANCE	CHECKS FAILED

16 rules were analysed across 1 inline layer(s). 2 of 6 compliance checks passed. This is the first recorded run of this package, so there is nothing yet to compare it against.

What needs a decision

FAIL **Telnet (TCP/23) is never permitted**

HOUSE-NO-TELNET · severity high

3 rule(s) match a condition this profile forbids.

House rule — no external standard cited

FAIL **Every rule carries a comment explaining why it exists**

HOUSE-DOCUMENTED · severity medium

16 rule(s) have no comments.

House rule — no external standard cited

FAIL **No disabled rules left in the package**

HOUSE-NO-DISABLED · severity low

1 disabled rule(s) remain in the package.

House rule — no external standard cited

FAIL **Every rule has a name**

HOUSE-NAMED · severity low

2 rule(s) have no name.

House rule — no external standard cited

What changed since the previous review

This is the first recorded review of this package. From the next run onward this section reports what moved.

What this review does not cover

This tool reads configuration. The list below is not a caveat added for safety — it is the set of questions a configuration reader cannot answer, and a decision taken from the pages above should be taken knowing they are open.

Also true of every review this tool produces:

- Traffic paths are simulated from configuration. No packet is sent, and a live gateway log can still differ.
- A rule this tool cannot model statically is reported as unknown, never as safe and never as a violation.
- There is no compliance percentage. A single number would have to price an unverifiable check, and every available price misleads.
- Hit counts come from the Management API as running totals; this tool does not interpolate between readings.
